

Requirements to self-host Clarity titles

Software

PHP 5 with modules for curl, gmp, mcrypt

MySQL 5 or Microsoft SQLServer 2005 or newer

If you connect to SQLServer, you also need the PHP odbtp module and installation -
<http://odbtp.sourceforge.net/>

ZEND Optimizer - <http://www.zend.com/en/downloads/>

Suggested hardware and os to support up to 10,000 users

Ethernet 1GB card

4GB RAM

Windows 2003 server (SP2) or Linux

Dual core 3GHz processors (AMD or Intel)

Acceptable hardware for around 5000 users

Ethernet 100MB card

2GB RAM

Dual core 2GHz processors

Suggestions for larger installations

Lots of RAM!

Separate servers for the database and application.

Two hard disks on the database server; one for the database and one for the logs.

Remote access

To self-host a Clarity title you must allow Clarity remote access to read the folder where the Clarity software is installed and the database tables used by the application. We just need read-only access, unless you would like us to assist with upgrades or trouble-shooting. We promise to never take any data from your server without permission or to disclose any data outside our internal support team. We can provide a fixed IP address for added security.
